  The invention relates to a plasmid with a nucleic acid sequence of 6122, 6125, or 5683 base pairs fully defined in the specification. The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and B. coli. The new vectors have been designed to overcome certain drawbacks of the pCombix plasmid. These new vectors include pRLS, pRLS-CAT, pRLS asc-CAT and pRLS bsi-CAT. This polymucles is accordance of the plasmid pRLS bsi-CAT nucleic acid

Plasmid for in situ production of genes, comprises two template annealing sequences, such as downstream primer and upstream collar sequence and a restriction site located between the annealing sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of plasmid pRL5-CAT, a derivative of pComb 3X which has been modified to contain chloramphenicol resistance. The invention relates to the engineering of plasmids, of which pRL-CAT is a preferred example, for in situ production of genes. It was found that nucleic acids encoding a polypeptide can be directly incorporated into a plasmid by DNA polymerisation or by reverse transcription of a nucleic acid template. Preferably, nucleic acids encoding at least a portion of an antibody can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Barbas-Frederickson S, Lin Y, Renshaw M, Wild M;

           mENA. The plasmids are engineered to contain 2 template annealing sequences (see ABN84079-80 and ABN84082-83), i.e. a downstream primer that anneals to a first portion of a nucleic acid template, e.g. mENA encoding at least a portion of an antibody, an upstream collar sequence that anneals to a second portion of the template, and at least 1 restriction site located between the 2 template annealing sequences. A single-stranded DNA plasmid vector is produced containing a nucleic acid encoding at least a portion of a polypeptide, e.g. a light chain and/or a heavy chain of an antibody. This vector can be transformed into a host cell and
directly incorporated into the plasmid by reverse transcription of mRNA. The plasmids are engineered to contain 2 template annealing

6125, or 5683 base pairs fully defined in the specification. The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and B. coli. The new vectors have been designed to overcome certain drawbacks of the pComb3x plasmid These polynucleotis include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bs1-CAT. This sequence of the invention.
                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                    The invention relates to a plasmid with a nucleic acid sequence of 6122,

modified version of the pagenid expression vector, prombs given in AAQ92546. pho-TT provides for the expression of soluble Fabs which are secreted into the periplasmic space which is regulated from the alkaline phosphatase (phoA) promoter. This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise heavy and light variable regions which bind to HIV 99120. pho-TT consists of a DNA molecule having two cassettes to express two soluble proteins a heavy chain and a light chain. The vector comprises, operatively linked 5' to 3', a first cassette consisting of the phoA promoter/operator sequences, an ECORI restriction site, a ribosome binding site (RBS), an OmpA leader, a Sfil restriction site, a spacer sequences, an moral residual and 3' Spal restriction cassette consisting of an expression control RBS, a PelB leader, a human consensus amno terminus site between the two cassettees, and a second cassette consisting of an expression control RBS, a PelB leader, a human consensus amno terminus site between the two cassettees and a Notle sequence BVOLLE, a cloning region bordered by 5' XNOI and 3' Spal restriction site.

Collowed by a Sfil site, expression control stop sequences and a NoI restriction site. The pbho-TT expression vector contains a light restriction site. The pho-TT expression of the heavy chain stuffer that is 1200 bp in length and a heavy chain stuffer that is 1200 bp in length and a heavy chain stuffer that is 1200 by in length and a heavy chain stuffer that is 1200 by in length and a heavy chain stuffer that is the contains and light chain variable domains of a contains and solutions and a second case and a second case and a substance and a light chain stuffer second case and a light chain variable domains of a
This sequence represents the expression vector, pPho-TT which is a modified version of the phacemid expression vector modified version of the phacemid expression vector.

Claim 1; page 8; 15pp; English

This Omp A signal peptide-encoding sequence is contained in a

recombinant plasmid, flanked on its 3' side by a Mirabilis antiviral protein (MAP) gene. The plasmid is used to transform E.coli host cells in the large-scale prodn. of MAP. The 5' end overhangs the 3' end of the complementary strand by TA and the 5' end of the complementary strand overhangs the 3' end of this sense strand by CTAG. See also AAQ10568. 8X88888XX

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 43,

                                                                                                                                    The present invention relates to a method of producing extracellularly secreted, active, correctly folded, recombinant tissue plasminogen activacor (tPA), Kringle 2 serine protease molecule (K2S) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, pulmonary embolism, any artery occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain), peripherally occluded arteries, coronary artery occlusion, deep vein thrombosis or related diseases associated with unwanted blood clotting. The present sequence is a fusion protein comprising OmpA and K2S protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MKKTAIAIAVALAGFATVAQAASEGNSDCYFGNGSAYRGTHSLTESGASCLPWNSMILIG 60
Producing active, correctly folded recombinant tissue plasminogen activator, Kringle 2 serine protease in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MKKTAIAIAVALAGFATVAQAASEGNSDCYFGNGSAYRGTHSLTESGASCLPWNSMILIG

                                                                                                                                                                                                                                                                                                                   human mRNA for tissue plasminogen activator (tPA) It shares human mRNA for tissue plasminogen activator des AAMR9769; designated tissue plasminogen activator-like protease (t-PALP). The homology between t-PALP and tPA indicates that t-PALP may be involved in the regulation of normal and abnormal clotting in e.g. stroke, deep-vein thrombosis, peripheral arterial occlusion, pulmonary embolism and myocardiothrombosis.

                                                                                                                                                                                                                                                                                                                                     The sequence given is a modified tissue plasminogen activator (tPA), mt-PA6 is diglycosylated, and lacks the finger, EGF and Kringle I domains. It may be used as a thrombolytic agent. The novel tPA posseses the properties of sparing plasminogen and fibrinogen while displaying a longer in vivo half life and providing greater maintenance of coronary blood flow.

                                                                                                                                                                                                                                                                                                                                                                                                                                      Amino acid residues 2-89 contain the fibronectin and EGF regions of human tPA. Deletion of these regions results in a tissue plasminogen activator with reduced affinity for liver cell membranes, the mutant protein is not cleared from the circulation as rapidly as is wild-type tPA. The specification only gives the sequence around the deletion and not the full-length sequence of "delta 2-89 tPA"; the sequence in AAR68851 has been obtained by amending a previously disclosed wild-type human tPA sequence (from DE3930099) according to
Human; des-epidermal growth factor homologous plasminogen activator; tPA; liver membrane; reduced affinity; EGF homologous; thrombosis; thrombolytic; increased half-life.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This non-glycosylated tPA deriv. lacks the finger- and EGF-domains. It has a lower clearance rate (longer half-life) than natural tPA while retaining thrombolytic activity and stimulation by fibrin. It is produced by recombinant methods and site-specific muta-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  with

                                                                                                                                                                                                                                                                        Human; des-epidermal growth factor homologous plasminogen activator; tPA; liver membrane; reduced affinity; EGF homologous; thrombosis; thrombolytic; increased half-life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Amino acid residues 55-62 fall within the EGF region of human tPA. Deletion of these residues results in a tissue plasminogen activator with reduced affinity for liver cell membranes; the mutant protein is not cleared from the circulation as rapidly as is wild-type tPA. The specification only gives the sequence around the deletion and not the full-length sequence of "delta 55-62 tPA"; the sequence in AAR68852 has been obtained by amending a previously disclosed wild-type human tPA sequence (from DE3930099) according to the description given in Example 6. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                /note= "amino acids 55-62 of tPA have been deleted"

The nature of the side chain depends on the host cell used.

The analogue has a longer half life and may be administered at

```

84

an t to Kawasaki T; The tPA analogue carries an oligosaccharide side chain linked the Asn residue replacing either Tyr-67 or Ile-86. The nature of the side chain depends on the host call used.

The analogue has a longer half life and may be administered at New tissue plasminogen activator analogues -contg. glycosylated asparagine unit for increased half-life. /note="Asn linked to oligosaccharide" Kato M, Kinoshita A, (Updated on 25-MAR-2003 to correct PA field.) 527 AA; Sequence

                       The t-PA has the following amino acids of the mature protein replaced: N(37) for S, S(38) for V, G(39) for V, R(40) for E, A(41) for F and Q(42) for S. The deriv. has improved persistence in the blood compared with native t-PA, while retaining the same level of thrombolytic activity. It can be used for the treatment of thrombotic disorders such as myocardial infarction.
                                                                                                                                                                                                                                                                                     ACSEGNSDCYFGNGSAYRGTHSLTESGASCLPWNSMILIGKVYTAQNPSAQALGLGKHNY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                   The t-PA has the following amino acids of the mature protein replaced: N(37) for S, S(38) for V, G(39) for V, R(40) for I, A(41) for V and O(42) for S. The deriv. has improved persistence in the blood compared with native t-PA, while retaining the same level thrombolytic activity. It can be used for the treatment of thrombotic disorders such as myocardial infarction.
tissue plasminogen derivs. - having amino acid replacements increase persistence in the blood while retaining thrombolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tissue plasminogen activator; thrombolysis; myocardial infarction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The t-PA has the following amino acids of the mature protein replaced: N(115) for P and one of N(37) for S, S(38) for V, G(39) for Y, R(40) for E, A(41) for S and Q(42) for S.

The deriv. has improved persistence in the blood compared with native t-PA, while retaining the same level of thrombolytic activity. It can be used for the treatment of thrombotic disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CRNPDGDAKPWCHVLKNRRLTWEYCDVPSCSTCGLRQYSQPQFRIKGGLFADIASHPWQA

                                                                                                                                                                                                                                                                             The t-PA has the following amino acids of the mature protein replaced: G(161) for R, K(162) for R and S(165) for W. The deriv. has improved persistence in the blood compared with native t-PA, while retaining the same level of thrombolytic activity. It can be used for the treatment of thrombotic disorders such as myocardial infarction.
